Scenario: Project "DeepHealth"

The Objective: A multi-site study to develop an AI-driven tool that predicts health risks by merging genomic markers with social determinants of health (SDOH).

The Stakeholders

- **The University (Genomics Lab):** Focused on high-impact publications and "Open Science." They operate under a federal grant requiring data to be Findable and Accessible in public repositories within 12 months of collection.
- **The Community Clinic (Patient Advocacy):** Provides access to 5,000 high-risk patients. Their priority is Security and community trust. They are wary of "data extraction" and fear that sharing sensitive histories could stigmatize their patients or lead to insurance discrimination.
- **The Tech Partner (AI Solutions Corp):** Provides a proprietary machine-learning platform. They want the data to train their models, but they want to keep the "processed" data and the resulting algorithms secure and proprietary for commercial use.

The "Friction Points" (To be resolved)

1. **The Interoperability Gap:** The Clinic's data is in narrative PDF format (notes); the University's is in structured genomic files. The Tech Partner wants both converted to their proprietary format, which the others cannot access without a paid license.
2. **The Timeline Conflict:** The University wants to upload raw genomic data to a public server *now* to meet grant milestones. The Clinic wants a "Community Review Board" to approve every data release first.
3. **The Reusability Dilemma:** If the Tech Partner improves their AI model using this data, can the University use that improved model for their *next* project without paying?

As a group, you must negotiate the "Team Data Agreement." You have **20 minutes** to agree on:

- **Ownership:** Who "owns" the merged dataset?
- **Access:** Does the Clinic have the right to "veto" a data release?
- **FAIRness:** How will you make the data Interoperable without forcing everyone to buy the Tech Partner's software?
